CAPE GENERAL CATALOGUE OF STARS

FOR

1900·0.

INTRODUCTION.

THE Results contained in the following Catalogue are based upon observations made with the non-reversible Transit Circle in the years 1900 to 1904 inclusive.

In the original publication of the daily results the places of the Clock-stars are given reduced to the Epoch and Equinox of 1900, all other stars to the mean epoch of observation and the Equinox 1900·0. *In the present Catalogue the places of all stars are given for the mean epoch of observation and the Equinox of 1900·0.*

The separate results of the observations upon which each star-place depends are given in the *Results of Meridian Observations made at the Royal Observatory, Cape of Good Hope, in the years 1900 to 1904*, already published, where a complete account is given of the methods of observation and reduction which have been employed.

It is sufficient here to state the following facts :—

The instrument employed was the non-reversible Transit Circle on Airy's plan, which has been in use since 1856, and which has been modified in detail, as described in successive volumes of *Cape Meridian Observations*.

The Right Ascensions were observed by the Chronographic method.

The places of the Clock-stars employed were those of Newcomb's Fundamental Catalogue.

The results, for reasons subsequently explained, are divided into two main Catalogues.

CAPE CATALOGUE, 1900, I.

This Catalogue contains the mean places of 3365 stars North of the Zenith of the Cape, and includes all the 2798 Zodiacal Stars which are referred to in the following resolution of the "Conférence internationale des étoiles fondamentales," which was held at Paris in 1896.

Résolution 9.

- a.* Il y a lieu d'adopter un Catalogue commun d'étoiles zodiacales pour les observations de planètes effectuées par les méthodes héliométriques ou par d'autres méthodes différentielles, et de prendre, comme point de départ pour sa construction, les positions du Catalogue fondamental provisoire.
- b.* La distribution des étoiles sera celle qui a été proposée par M. Gill.
- c.* L'observation de ces étoiles sera recommandée d'une manière particulière aux Observatoires.

The stars have been chosen so that the position of any other object within the Zodiacal zone can be accurately determined by differential measures with the Heliumeter, and care was taken to exceed as little as possible the minimum number of stars necessary for fully attaining this end.

The limits of the Zodiacal Catalogue are sufficiently wide to permit the determination of the Moon's place at any observatory, by Heliumeter measures of the distance or position-angle of a Lunar crater from suitable surrounding stars, in any part of the Moon's orbit, or to determine in a similar way the position of any of the major planets.

It is, of course, practically impossible to determine with the highest accuracy the positions of all the stars that *may* be employed for these purposes, or of all stars that may be occulted by the Moon. But we shall evidently secure greater concentration of effort and higher accuracy in the resulting star-places if the attention of meridian observers is concentrated on the observations of those stars which are most necessary for the purpose in question, and if, at the same time, the observations of these stars are carried out in the manner most likely to eliminate systematic error from the results.

Granted that, at two sufficiently separate epochs, all the stars of this list have been well observed at eight or ten different observatories, and that the positions and proper motions have been thus adequately determined, it would then be possible, by

Heliometer or photographic observation, to determine differentially, with very little labour, the true position of any star (such as a star of which an occultation had been observed) with a probable error not exceeding $\pm 0''.10$.

The publication of this star-list has been followed by the cordial co-operation of the following Observatories :—

Cambridge (England).	Heidelberg.
Cape of Good Hope.	Königsberg.
Dunsink.	Lick.
Edinburgh.	Washington.

The Directors of all these Institutions have undertaken to make four or five meridian observations of each of the 2798 stars of the Zodiacal list.

This should be sufficient to insure an adequate determination of the star-places for the epoch 1900. If these stars are similarly observed at intervals of 25 years, Astronomers will be provided with all the data requisite for the most rigorous determination of places of the moon and planets.

This Catalogue also contains, besides the results of the Cape Meridian Observations of those 2798 Zodiacal Stars :—

- a.* Stars not contained in the Cape Catalogue for 1885 and 1890 of which Occultations have been observed at the Cape.
- b.* Additional Comparison Stars which have been employed in Planetary and Comet Observations at the Cape.
- c.* Stars employed in Survey operations.
- d.* Stars 8.5 mag. or brighter, North of the Zenith of the Cape Observatory, contained in the Cape Photographic Durchmusterung, which are not in any catalogue of precision.
- e.* Stars, North of the Zenith of the Cape Observatory, requiring further observation in connection with queries raised in the revision of the C.P.D.
- f.* Additional stars used as reference or comparison stars in the Heliometer Observations of planets at the Cape since 1897.*

* Since the end of 1897 all the oppositions of major planets have been observed with the Heliometer at the Cape.

The only subsequent Correction applied to the individual observations of R.A. already published has been the observers' personal equation depending on the magnitude of the star (*loc. cit.* pp. xiii. to xvii.) :—

Corrections for Personal Equation in R.A. depending on Magnitude.

10	—0·207	—0·065	—0·036	—0·050	—0·047	—0·071	—0·121	—0·050

The Corrections which have been applied to the separate results of Declination are :—

- (1) The correction + $0''\cdot35 \sin Z.D.$ (South) for flexure (*loc. cit.* p. xi.).
- (2) The correction of $-0''\cdot38$ to the originally adopted latitude $-33^{\circ} 56' 3''\cdot20$ (*loc. cit.* p. xviii.).
- (3) A correction to reduce the results to the system of Newcomb's Declinations, derived from comparison of the Cape Declinations with the Declinations of Newcomb's Fundamental Catalogue (*loc. cit.* pp. xix. to xxx.).

Thus the Cape Catalogue, 1900, I., should agree systematically with Newcomb's Fundamental Catalogue.

CAPE CATALOGUE, 1900, II.

This Catalogue contains 995 stars, selected as follows :—

- (1) All stars of 8·5 magnitude or brighter, South of the Zenith of the Cape Observatory, which are contained in the Cape Photographic Durchmusterung but not in any Catalogue of precision. Exception is made, however, of the stars situated between Declination -40° and -52° , because the few of these stars that do not occur in the Cape Catalogue of 8560 Astrographic Standards (1900) will be determined with all necessary precision from measurement of the Cape Astrographic plates.

- (2) Stars South of the Cape Zenith which required further observation in connection with queries raised in the revision of the C.P.D.
- (3) Comparison stars used in observations of Comets, etc.
- (4) Stars used in Survey Operations.

The observations of these stars have all been reduced precisely in the same way as for Catalogue I., except that the final correction applied to the Declinations in Catalogue I. (derived from comparison with Newcomb's Catalogue) has not been applied.

The Declinations of Catalogue II. should therefore be systematically comparable with those of the Cape Catalogues for 1885 and 1890.

The Right Ascensions are based on the Clock-stars of Newcomb's Fundamental Catalogue.

Reference to p. vi. of the Introduction to the *Meridian Observations*, 1900-04, will show that, as far as possible, the observations for Catalogue I. and Catalogue II. have been made on different nights, for the following reasons:—

“For observing the fainter stars it was found desirable to use an eyepiece without a reversing prism; at the same time it was necessary to avoid the introduction of personality depending on the apparent direction of motion across the field of view. For this purpose the work, as a rule, was divided into nights or watches on which (apart from circumpolar stars, which were always observed with the reversing eyepiece) all the observations were made either to the north or to the south of the zenith. Thus, on nights when only stars north of the zenith were observed, the plain eyepiece was employed for the observation of all stars; but on nights when stars south of the zenith were observed, an eyepiece with a reversing prism was employed for observing the Clock-stars, so as to cause their apparent motion to be from right to left: that is to say, in the same direction with respect to the observer as that of the stars in upper transit south of the zenith. Towards the end of the work, when comparatively few observations were required to complete the Catalogue, it would have involved too much loss of time to adhere to the above programme. The plan was therefore adopted of observing two sets of Clock-stars on each night, one with the plain eyepiece, the other with the reversing eyepiece; the clock-error determined with the former being applied to the transits of northern stars, and that with the latter to stars south of the zenith.”

CAPE CATALOGUE.

CAPE CATALOGUE, 1900, III.

This Catalogue contains 63 faint stars of which occultations by the Moon have been observed. Their positions have been determined with the 7 or 18-inch equatorials by differential observations from the star whose number in Catalogue I. is given in the last Column.

CAPE CATALOGUE, 1900, IV.

This Catalogue contains the places of 41 stars which have been derived from measurement of special photographic plates.

Nos. 4431 to 4464 are stars brighter than 8·5 which occur in the C.P.D., but are not to be found in any catalogue of precision. They form a cluster of which the component stars are too close together for economic observation with the Transit Circle. The remainder of the list consists of faint stars of which occultations by the Moon have been observed.

EXPLANATION OF SEPARATE COLUMNS OF CATALOGUES.

Catalogues I. and II. have been arranged as follows :—

1. *No.*—The ordinal number. An asterisk attached indicates a foot-note; † a double star and foot-note; such notes being on the left hand side of the page.
2. *Mag.*—Harvard determinations of magnitude are unmarked; those of Cordoba are marked *; those of B.D. †; those of the Cape ‡ without foot-note; others ‡ with foot-note.
3. *Name.*—Auwers' Bradley has been adopted as the authority for Bayer's letters and Bradley's numbers. For other stars the Catalogue number is quoted in the following order of preference: Bradley; Mayer; Lacaille; Piazzzi; Lalande; W.B.; Brisbane; C.G.A; Cape, 1880; C.Z.; O.A. (original number); C.P.D.; Cordoba D.M.; and Gillis P.Z.
4. *Mean R.A., 1900.*—The star's R.A. for Equinox 1900·0 and *for the mean epoch of observation.*
5. *Precession, 1900.*—The Precession in R.A. computed with Newcomb's Constants, viz. :—

$$3^{\text{h}}07^{\text{m}}23^{\text{s}} + 1^{\text{s}}3365 \sin \alpha \tan \delta.$$

6. *Sec. Var.*, 1900.—The Secular Variation in R.A. computed by the formula:—

$$A + B \tan \delta + C \tan^2 \delta$$

where

$$\begin{aligned} A &= + 0^{\circ}.00186 + [7.81251] \sin 2 \alpha, \\ B &= [8.47510] \cos \alpha - [6.75435] \sin \alpha, \\ C &= [8.11353] \sin 2 \alpha. \end{aligned}$$

7. *Proper Motion*.—The Annual Proper Motion in Right Ascension. These proper motions depend for the greater part on the authority of Auwers. When the star is marked * in the Ledger No. Column, the proper motion is taken from Newcomb's Fundamental Catalogue. When marked ‡ in the same column, the star is contained in Newcomb's proposed list of Fundamental Stars but not in his Catalogue; when marked † the proper motion has been taken from some other authority which is mentioned in the notes at the right hand bottom corner of the page.
8. *Mean Dec.*—The Star's Declination for Equinox 1900.0 and for the mean epoch of observation.
9. *Precession*, 1900.—The Precession in Declination computed with Newcomb's constants, viz. :—
- $$20''.0468 \cos \alpha.$$
10. *Sec. Var.*, 1900.—The Secular Variation in Declination computed by the formula :—
- $$A' + B' \tan \delta$$
- where
- $$\begin{aligned} A' &= - [7.93044] \cos \alpha - [9.65119] \sin \alpha, \\ B' &= - [9.28965] \sin^2 \alpha. \end{aligned}$$
11. *Proper Motion*.—The Annual Proper Motion in Declination depending on the same authorities as those quoted in the case of the proper motion in R.A.
12. *No. of Obs.*—The number of Observations—generally identical in Right Ascension and Declination. In the few instances when these numbers are not identical, the left hand figure denotes the number of observations in R.A., the right hand figure that in Declination.
13. *Epoch*, 1900 +.—The mean Epoch of Observation, expressed in years in excess of 1900. In the few instances where the epochs are not identical, the left hand figures denote the mean Epoch for R.A., the right hand figures the mean Epoch for Declination.
14. *Ledger*, 1900–4.—This corresponds with the ordinal number in the *Cape Meridian Observations*, 1900–4.

Notes on double stars are generally omitted for distances under 1" or over 5".

Catalogues III. and IV. are self-explanatory.

OBSERVERS, Etc.

The Observers who made the observations on which the Catalogues I. and II. are based were:—

Mr Pett denoted by P.	Mr Woodgate, denoted by W.	To 1901 Feb.
„ Cox, „ C.	„ Cochrane, „ A. C.	To 1901 June.
„ Power, „ J. P.	„ Cheeseman, „ R. C.	From 1901 April.
„ Pead, „ A. P.	„ Wilkin, „ A. W.	From 1902 Jan.

The differential observations, the results of which are given in Catalogue III., were made by Mr Cox.

To Mr Power I am specially indebted for his large personal share in the preparation of the Catalogue and for his careful revision of the references and nomenclature.

The separate results for α Canis Majoris, β and α Centauri, given below, are reduced to Newcomb's system and the Equinox of 1900.0, but without correction for proper motion or parallax.

DAVID GILL.
